DATA SHEET

SDN8080G

80-outputs common/segment driver

To improve design and/or performance, Avant Electronics may make changes to its products. Please contact Avant Electronics for the latest versions of its products

1 GENERAL

1.1 Description

The SDN8080G is a COMMON/SEGMEMT driver for large-panel dot-matrix STN LCD module. It can be used either as a COMMON driver or as a SEGMENT driver, by connecting its CS input to VDD or VSS.

When its CS input is connected to VDD, the SDN8080G is an 80-COMMON driver. When its CS input is connected to VSS, the SDN8080G is an 80-SEGMENT driver.

1.2 Features

- Operating voltage range (VDD-VSS, control logic): 2.7 ~ 5.5 volts.
- LCD bias voltage range (VDD-VEE): 6 ~ 28 volts.
- 80-SEGMENT driver or 80-COMMON driver, via CS-pin selection.
- When used as a SEGMENT driver, 4-bit parallel or 1-bit serial interface with a controller.
- When used as a COMMON driver, two modes of operation are available: Single mode or Dual mode.
- Display duty cycle: 1/64 ~ 1/256.
- LCD on/off control, when used as SEGMENT driver.
- External 4-level LCD bias voltage.
- Operating frequency range: 8 MHz, when VDD= 5 volts.
- Operating temperature range: -30 to +85 °C.
- Storage temperature range: -55 to +150 °C.

2 ORDERING INFORMATION

Table 1 Ordering information

TYPE NUMBER	DESCRIPTION
SDN8080G-LQFPG	LQFP100 Pb-free package.
SDN8080G-QFPG	QFP100 Pb-free package.
SDN8080G-LQFP	LQFP100 general package.
SDN8080G-QFP	QFP100 general package.
SDN8080G-D	Tested die.

3 FUNCTIONAL BLOCK DIAGRAM AND DESCRIPTION

3.1 Functional block diagram

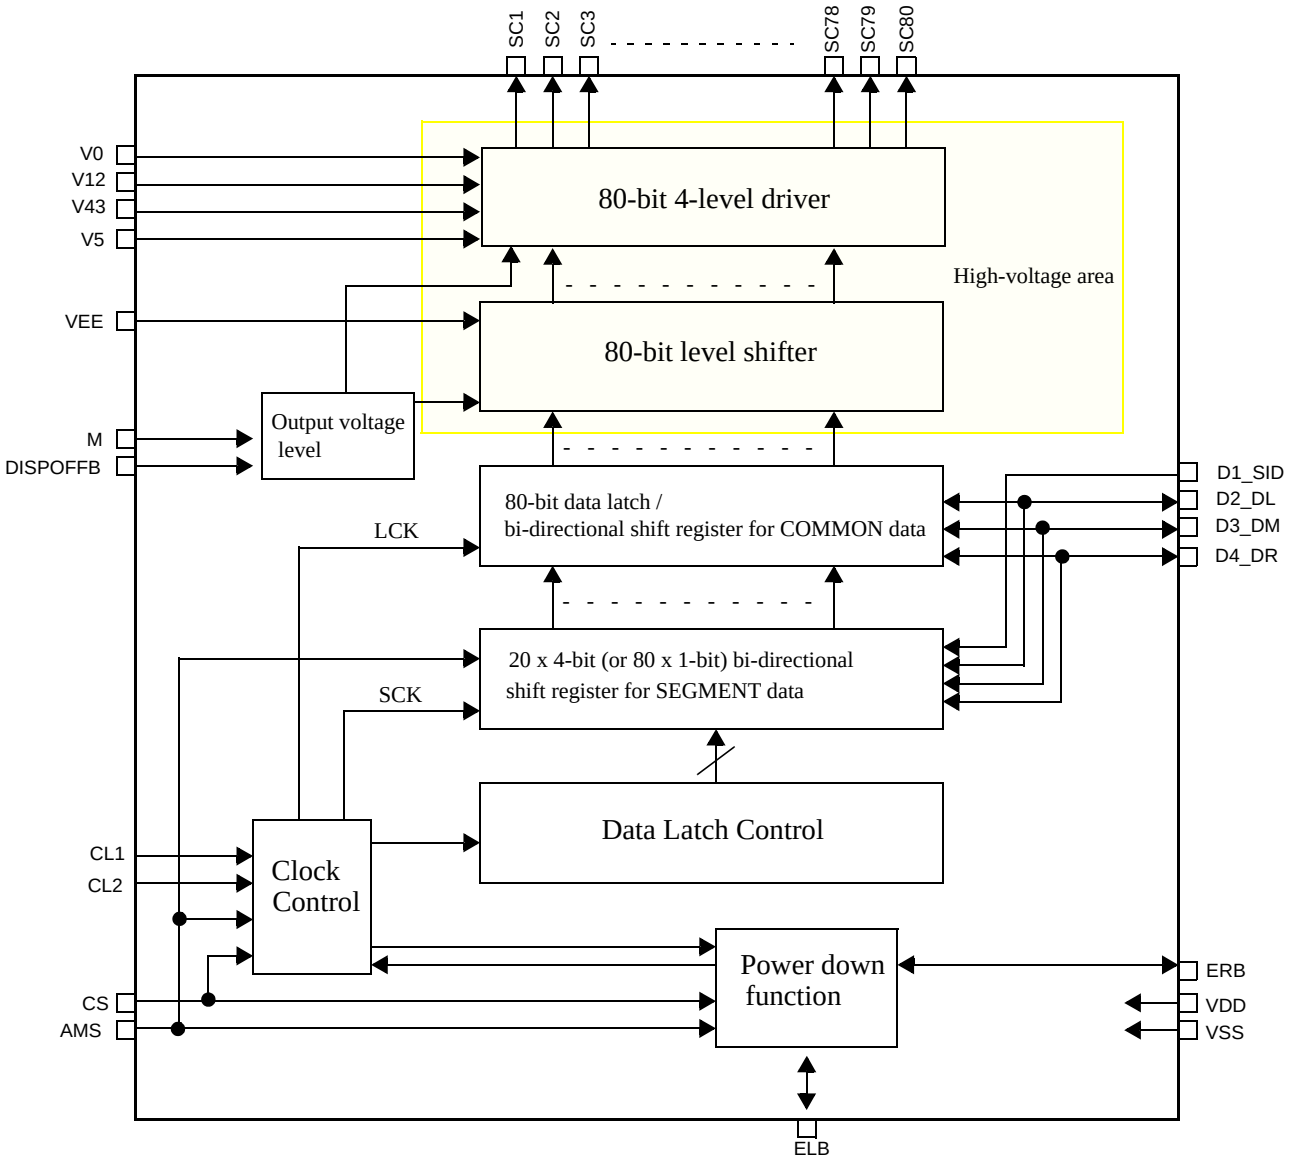

Fig.1 Functional diagram

3.2 Block description

Table 2 Block description

NAME	COM/SEG	DESCRIPTION
Clock control	COM/SEG	Inputs to this block are external signals CL1, CL2, CS, and AMS. It generates latch clock (LCK) and shift clock (SCK). SCK is used to shift display data into the 20 x 4-bit bi-directional shift register for SEGMENT data.
Data latch control	SEG	This block controls shift direction of the 20 x 4-bit shift register and selects its input data pins. In COMMON driver application, this block is disabled.
Power down function	SEG	This block enables or disables Clock Control block according to ERB/ELB input.
Output level selector	COM/SEG	Controls the output voltage level according to input signals M and DISPOFFB.
20 x 4-bit bi-directional shift register for SEGMENT data	SEG	This is the bi-directional 20 x 4-bit (80-bits) shift register for SEGMEMT data. In 1-bit serial interface mode of SEGMEN driver application, 80 SCK clocks are needed to shift in 80-bit data. In 4-bit parallel interface mode, only 20 SCK clocks are needed to shift in 80-bit data. In COMMON driver application, this block is disabled.
80-bit data latch, or bi-directional shift register for COMMON data	COM/SEG	In SEGMENT driver application, this block is used as an 80-bit data latch and the 80-bit data of the SEGMENT driver are latched into this latch for output. In single type COMMON driver application, this block is used as an 80-bit shift register. Depending on the value of SHL, 1-bit serial data is shifted into D2_DL or D4_DR. In dual type COMMON driver application, depending on the value of SHL, the 80-bits shift register is divided into two sections with each section having 40-bits. Data are then shifted into the shift register via D2_DL and D3_DM, or D3_DM and D4_DR. Please refer to Table 6 and Table 7.
80-bit level shifter	SEG	This block translates signals from logical voltage to high voltage for driving the STN LCD panel.
80-bit 4-level driver	SEG	Selects output voltage levels according to M and the latched data value.

4 PINNING DIAGRAMS

4.1 Pinning diagram of LQFP100 package

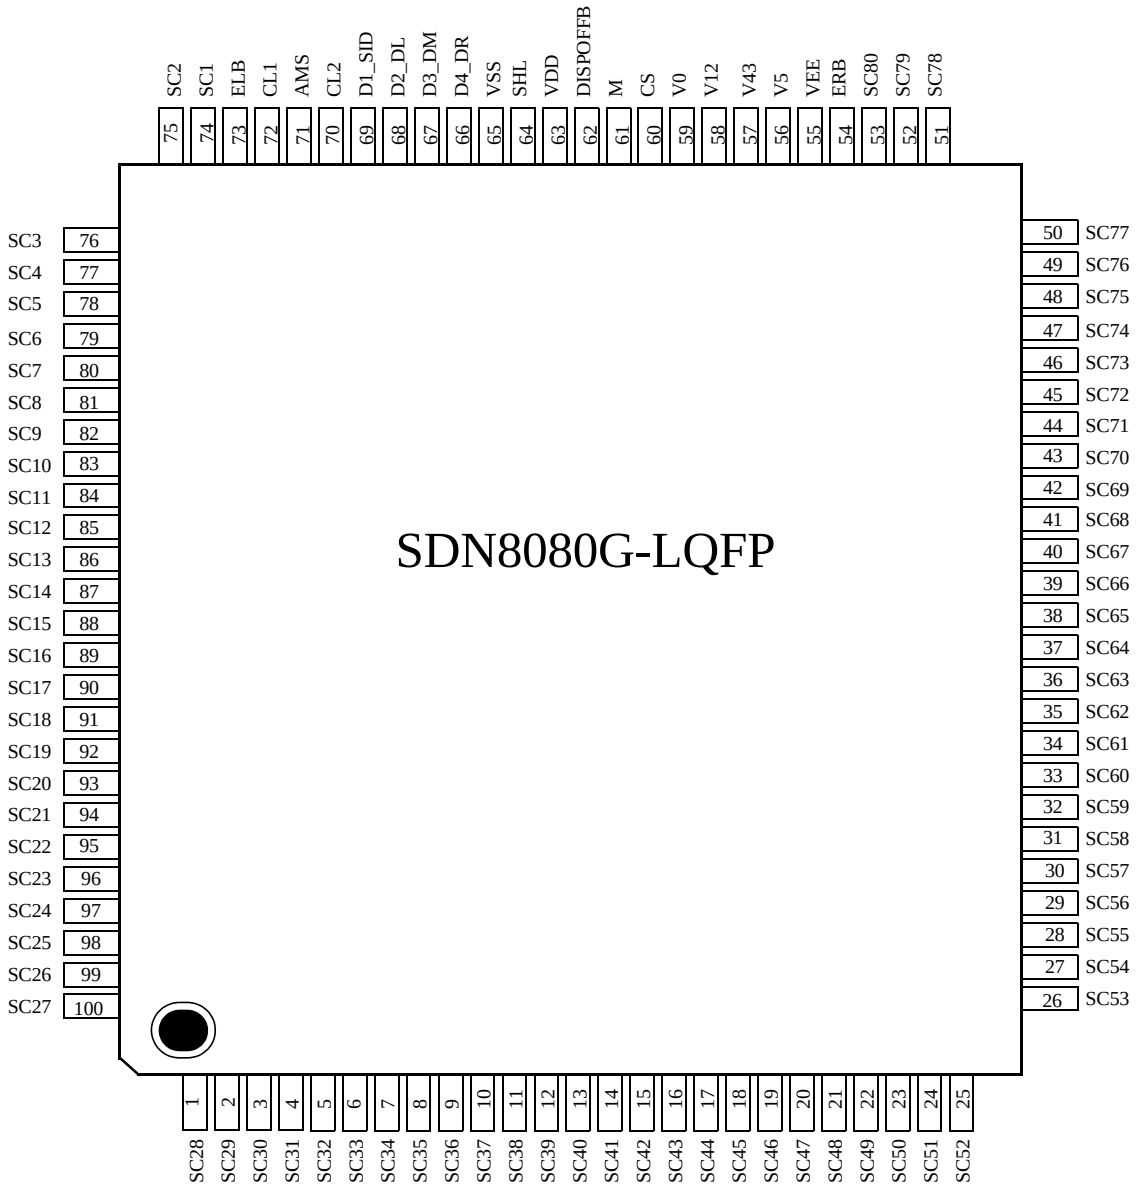

Fig.2 Pin assignment of the LQFP100 package.

4.2 Pinning diagram of QFP100 package

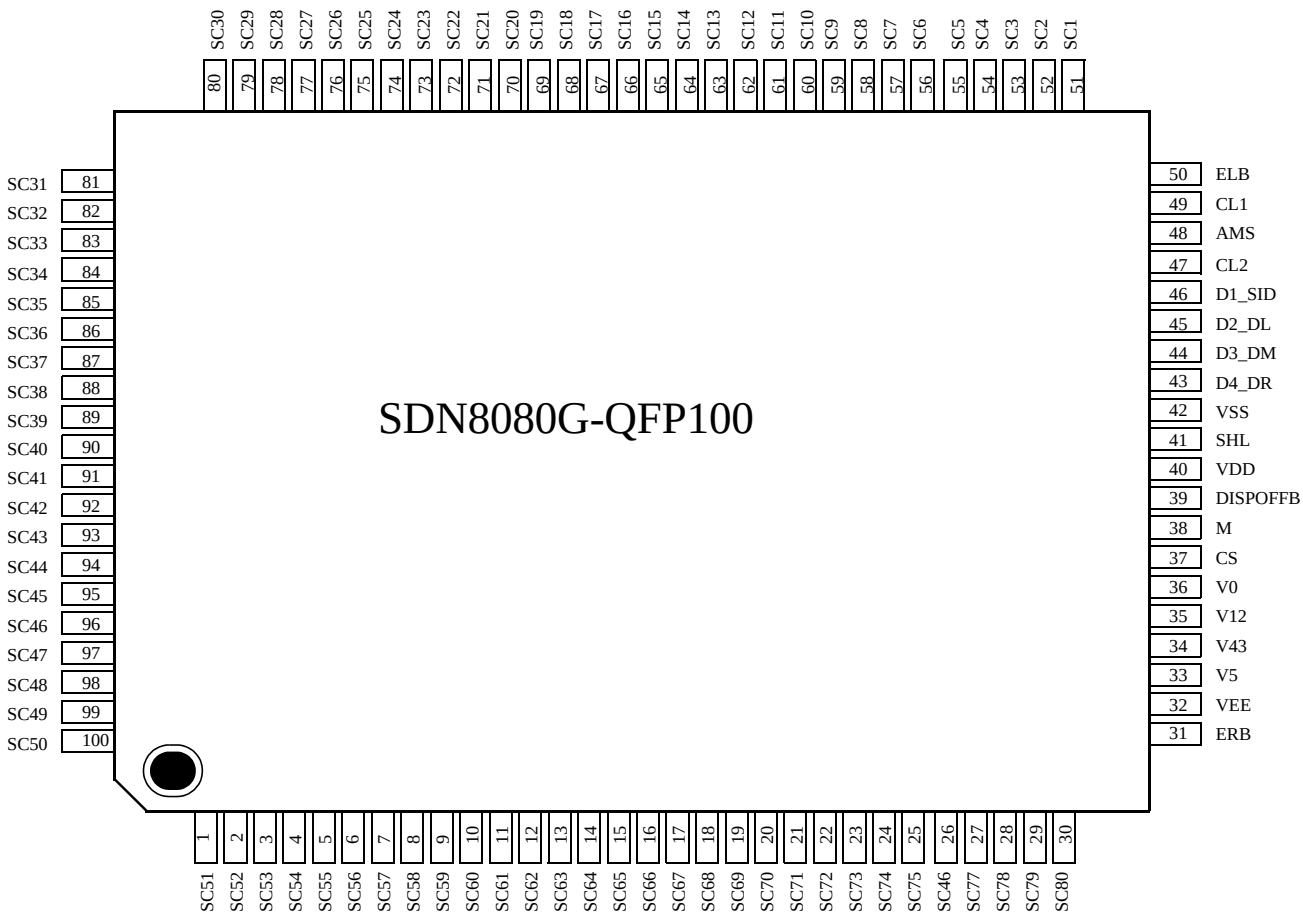

Fig.3 Pin assignment of the QFP100 package

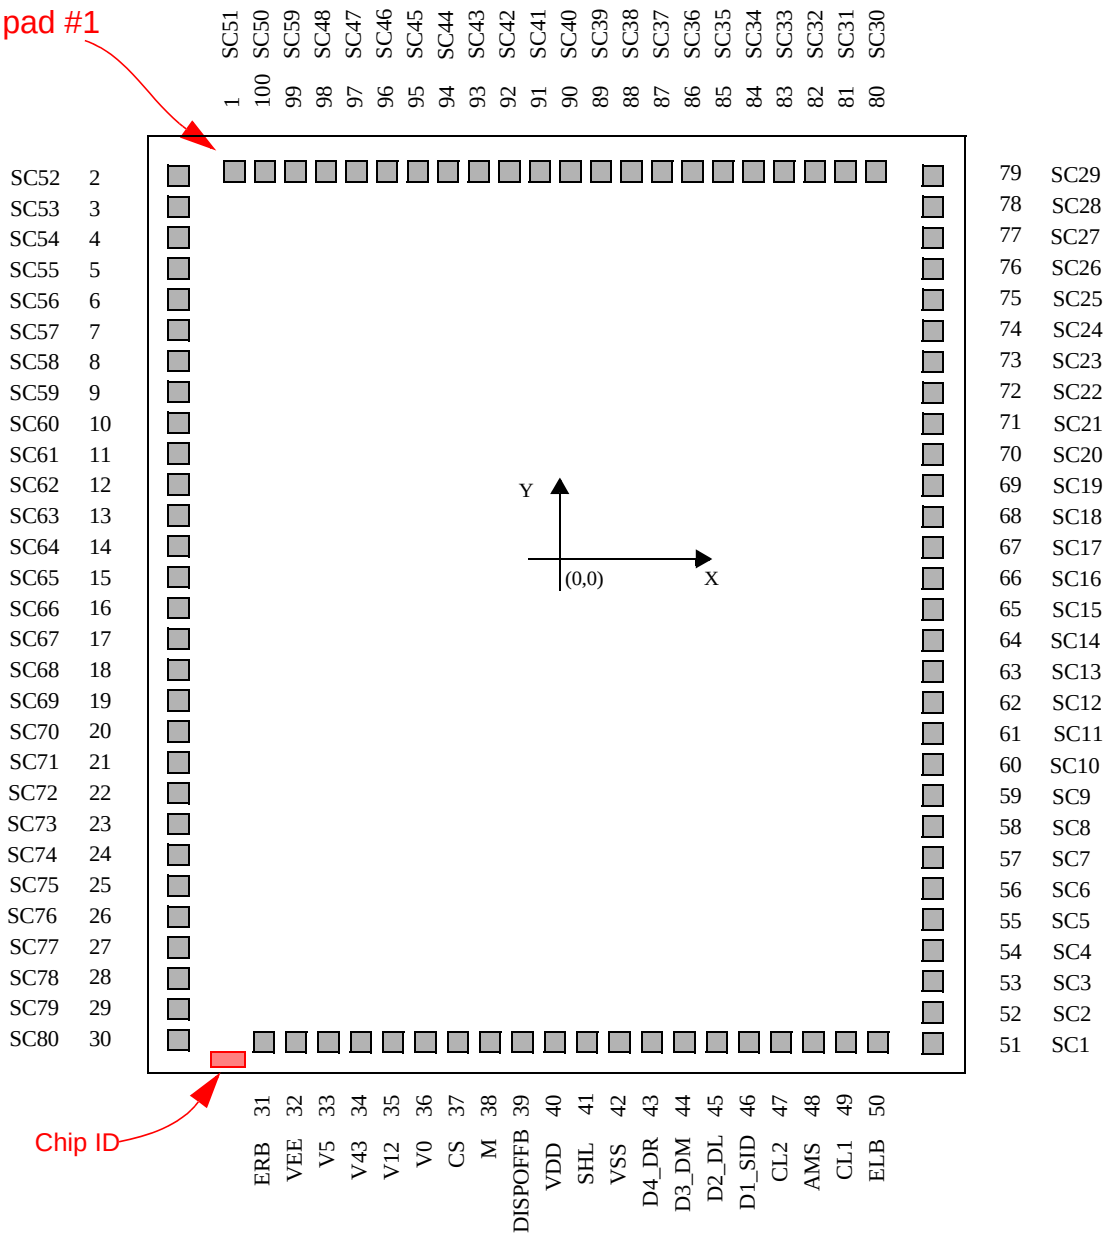
4.3 Pad diagram



Note:

1. For chip_on_board (COB) bonding, chip carrier should be connected to VDD or left open. Chip carrier is the metal pad to which die is attached.
2. The chip size is : 2775 μm x 3169 μm.
3. The Chip ID is: 30001.
4. PAD WINDOW SIZE : 86um x 86um

Fig.4 Pad locations.

7 DATA SHIFT DIRECTION AND DATA PIN I/O SELECTION

Table 6 Data shift direction in SEGMENT driver application (CS=LOW).

AMS	SHL	Application mode	DATA SHIFT DIRECTION	INPUT PIN(PAD)
L	L	4-bit parallel data interface mode		D1_SID, D2_DL, D3_DM, D4_DR
	H			
H	L	1-bit serial data interface mode		D1_SID
	H			

Table 7 Data shift direction in COMMON driver application (CS=HIGH)

AMS	SHL	Application mode	DATA SHIFT DIRECTION	Input pin(pad)
L	L	Single-type application mode		D2_DL
	H			D4_DR
H	L	dual-type application mode		D2_DL, D3_DM
	H			D4_DR, D3_DM

Table 8 Application of I/O data pins D1_SID, D2_DL, D3_DM, and D4_DR.

COM/SEG (CS pin)	Application mode (AMS pin)	SHL	Data interface pins			
			D1_SID	D2_DL	D3_DM	D4_DR
SEG (CS=LOW)	4-bit parallel interface mode (AMS=LOW)	X	D1 (input)	D2 (input)	D3 (input)	D4 (input)
	1-bit serial interface mode (AMS=HIGH)	X	D1_SID	connected to VDD.		
COM (CS=HIGH)	single-type application mode (AMS=LOW)	L	Open	D2_DL (input)	open	D4_DR (output)
		H		D2_DL (output)		D4_DR (input)
	dual-type application mode (AMS=HIGH)	L	Open	D2_DL (input1)	D3_DM (input2)	D2_DR (output2)
		H		D2_DL (output2)	D3_DM (input2)	D4_DR (input1)

8 ELECTRICAL CHARACTERISTICS

8.1 Absolute maximum rating

Table 9 Absolute maximum rating

SYMBOL	PARAMETER	MIN.	MAX.	UNIT
V_{DD}	voltage on the VDD input.	−0.3	+7.0	V
V_{LCD}	voltage difference between VDD and VEE.	0.0	+30.0	V
V_I (note 1)	input voltage on any pin with respect to V_{SS}	−0.3	V_{DD} + 0.3	V
I_I, I_O	input/output current on any I/O pin	−	±15	mA
P_{tot}	total power dissipation (note 2)	−	1.5	W
T_{stg}	storage temperature range	−55	+150	°C
T_{amb}	operating ambient temperature range.	-30	+ 85	°C

Notes

1. The following applies to the Absolute Maximum Ratings:
   a) Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device.
   b) This product includes circuitry specifically designed for the protection of its internal devices from the damaging effect of excessive static charge. However, it is suggested that conventional precautions be taken to avoid applying greater than the rated maxima.
   c) Parameters are valid over operating temperature range unless otherwise specified. All voltages are with respect to V_{SS} unless otherwise noted.
2. This value is based on the maximum allowable die temperature and the thermal resistance of the package, not on device power consumption.

8.2 DC characteristics for SEGMENT driver application

Table 10 DC Characteristics for SEGMENT driver application

V_{DD} = 5 V ±10%; V_{SS} = 0 V; all voltages with respect to V_{SS} unless otherwise specified; T_{amb} = −30 to +85 °C.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DD}	supply voltage	Control logic circuit	2.7	5.5	V
V_{LCD}	supply voltage for LCD	V_{LCD}= VDD - VEE	6	28	V
V_{IL}	LOW level input voltage	note 1	0	$0.2V_{DD}$	V
V_{IH}	HIGH level input voltage	note 1	$0.8V_{DD}$	V_{DD}	V
V_{OL}	LOW level output voltage	I_{OL} = 0.4 mA; note 2	–	0.4	V
V_{OH}	HIGH level output voltage	I_{OH} = -0.4 mA; note 2	V_{DD} − 0.4		V
I_{LI1}	input leakage current of input pins	note 1	−10	10	μA
I_{LI2}	input leakage current of V0~V5	note 3	−25	+25	μA
I_{STBY}	Standby current at VDD=5 volts	note 4		100	μA
I_{STBY}	Standby current at VDD=3 volts	note 5		100	μA
$I_{DD(VDD=5V)}$	Operating current at VDD=5 volts	note 6		5	mA
$I_{DD(VDD=3V)}$	Operating current at VDD=3 volts	note 7		2	mA
I_{EE}	High-voltage operating current.	note 8		500	μA
R_{ON}	ON resistance	I_{ON}= 100μA, note 9	2K (typ.), 4K (max.)		Ω

Notes to the DC characteristics:

1. Measured for the following pins: CL1, CL2, ELB, ERB, D1_SID, D2_DL, D3_DM, D4_DR, SHL, DISPOFFB, M, CS, and AMS.
2. Measured for the ERB pin and the ELB pin.
3. Measured for V0, V12, V43, and V5.
4. Conditions for the measurement: VDD=5V, V0=VDD, V12=1.71 V, V43= -19.71 V, V5=VEE= -23 V, F_{CL1}=32 KHz, F_{CL2}=5.12 MHz, SHL=VSS, DISPLAYOFFB=VDD, M=VSS, AMS=0, no-load condition (1/256 duty, 1/17 bias), display data pattern= 0000.
5. Conditions for the measurement: VDD=3V, V0=VDD, V12=-0.06 V, V43= -19.94 V, V5=VEE= -23 V, F_{CL1}=32 KHz, F_{CL2}=5.12 MHz, SHL=VSS, DISPLAYOFFB=VDD, M=VSS, AMS=0, no-load condition (1/256 duty, 1/17 bias), display data pattern= 0000.
6. Conditions for the measurement: VDD=5V, V0=VDD, V12=1.71 V, V43= -19.71 V, V5=VEE= -23 V, F_{CL1}=32 KHz, F_{CL2}=5.12 MHz, SHL=VSS, DISPLAYOFFB=VDD, F_M=80 Hz, AMS=0, no-load condition (1/256 duty, 1/17 bias), display data pattern= 01010.
7. Conditions for the measurement: VDD=3V, V0=VDD, V12=-0.06 V, V43= -19.94 V, V5=VEE= -23 V, F_{CL1}=32 KHz, F_{CL2}=4 MHz, SHL=VSS, DISPLAYOFFB=VDD, F_M=80 Hz, AMS=0, no-load condition (1/256 duty, 1/17 bias), display data pattern= 01010.
8. Conditions for the measurement: VDD=5V, V0=VDD, V12=1.71 V, V43= -19.71 V, V5=VEE= -23 V, F_{CL1}=32 KHz, F_{CL2}=5.12 MHz, SHL=VSS, DISPLAYOFFB=VDD, F_M=80 Hz, AMS=0, no-load condition (1/256 duty, 1/17 bias), display data pattern= 01010. Measured at VEE pin.
9. Conditions for the measurement: VLCD=VDD-VEE, V0=VDD=5V, V5=VEE=-23V, V12= VDD - (2/N) x VLCD, V43=VEE + (2/N) x VLCD, N=17 (1/256 duty, 1/17 bias).

8.3 DC characteristics for COMMON driver application

Table 11 DC Characteristics for COMMON driver application

V_{DD} = 5 V ±10%; V_{SS} = 0 V; all voltages with respect to V_{SS} unless otherwise specified; T_{amb} = −30 to +85 °C.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DD}	supply voltage	Control logic part	2.7	5.5	V
V_{LCD}	supply voltage for LCD	V_{LCD}= VDD - VEE	6	28	V
V_{IL}	LOW level input voltage	note 1	0	$0.2V_{DD}$	V
V_{IH}	HIGH level input voltage	note 1	$0.8V_{DD}$	V_{DD}	V
V_{OL}	LOW level output voltage	I_{OL} = 0.4 mA; note 2	–	0.4	V
V_{OH}	HIGH level output voltage	I_{OH} = -0.4 mA; note 2	$V_{DD} - 0.4$		V
I_{LI1}	input leakage current of input pins	note 1	−10	10	μA
I_{LI2}	input leakage current of V0~V5 pins	note 3	−25	+25	μA
I_{LI3}	input leakage current of input pins with internal pull-up MOS.	note 4	−25	+25	μA
I_{STBY}	Standby current at VDD=5 volts	note 5		100	μA
I_{STBY}	Standby current at VDD=3 volts	note 6		100	μA
$I_{DD(VDD=5V)}$	Operating current at VDD=5 volts	note 7		200	μA
$I_{DD(VDD=3V)}$	Operating current at VDD=3 volts	note 8		120	μA
I_{EE}	High-voltage operating current.	note 9		500	μA
R_{ON}	ON resistance	I_{ON}= 100μA, note 10	2K (typ.), 4K (max.)		Ω

Notes to the DC characteristics

1. Measured for the following input pins: CL1, D2_DL(when SHL=LOW), D4_DR(when SHL=HIGH), SHL, DISPOFFB, M, CS, and AMS.
2. Measured for the following output pins: D2_DL(when SHL=HIGH) and D4_DR(when SHL=LOW).
3. Measured for V0, V12, V43, and V5.
4. Measured for the following input pins with internal pull-up: CL2, D1_SID, D3_DM(AMS=HIGH), ELB(SHL=LOW), ERB(SHL=HIGH).
5. Conditions for the measurement: VDD=5V, V0=VDD, V12=3.35 V, V43= -21.35 V, V5=VEE= -23 V, F_{CL1}=32 KHz, F_{CL2}=disabled, SHL=VSS, DISPLAYOFFB=VDD, D2_DL=M=VSS, AMS=0, no-load condition (1/256 duty, 1/17 bias), D1_SID=D3_DM=VDD, D4_DR=ELB=ERB=OPEN.
6. Conditions for the measurement: VDD=5V, V0=VDD, V12=1.47 V, V43= -21.47 V, V5=VEE= -23 V, F_{CL1}=32 KHz, F_{CL2}=disabled, SHL=VSS, DISPLAYOFFB=VDD, D2_DL=M=VSS, AMS=0, no-load condition (1/256 duty, 1/17 bias), D1_SID=D3_DM=VDD, D4_DR=ELB=ERB=OPEN.
7. Conditions for the measurement: VDD=5V, V0=VDD, V12=3.35 V, V43= -21.35 V, V5=VEE= -23 V, F_{CL1}=32 KHz, F_{CL2}=disabled, SHL=VSS, DISPLAYOFFB=VDD, D2_DL=VDD, f_M=80Hz, AMS=0, no-load condition (1/256 duty, 1/17 bias), D1_SID=D3_DM=VDD, D4_DR=ELB=ERB=OPEN.
   Display data pattern= 10000000..., 01000000..., 00100000..., 00010000.
8. Conditions for the measurement: VDD=3V, V0=VDD, V12=1.47 V, V43= -21.47 V, V5=VEE= -23 V, F_{CL1}=32 KHz, F_{CL2}=disabled, SHL=VSS, DISPLAYOFFB=VDD, D2_DL=VDD, f_M=80Hz, AMS=0, no-load condition (1/256 duty, 1/17 bias), D1_SID=D3_DM=VDD, D4_DR=ELB=ERB=OPEN.
   Display data pattern= 10000000..., 01000000..., 00100000..., 00010000.
9. Conditions for the measurement: VDD=5V, V0=VDD, V12=3.35 V, V43= -21.35 V, V5=VEE= -23 V, F_{CL1}=32 KHz, F_{CL2}=disabled, SHL=VSS, DISPLAYOFFB=VDD, D2_DL=VDD, f_M=80Hz, AMS=0, no-load condition (1/256 duty, 1/17 bias), D1_SID=D3_DM=VDD, D4_DR=ELB=ERB=OPEN.

Display data pattern= 10000000..., 01000000..., 00100000..., 00010000.
Measured at the VEE pin (that is, current flowing through the VEE pad).

10. VLCD= VDD-VEE, V0=VDD=5 volts, V5=VEE=-23 volts. V12= VDD- (1/N) x VLCD, V43= VEE+ (1/N) x VLCD, N=17(1/256 duty, 1/17 bias).

8.4 AC characteristics for SEGMENT driver application

Table 12 AC characteristics for SEGMENT driver application

V_{DD} = 5 V ±10%; V_{SS} = 0 V; T_{amb} = -30 °C to +85°C.

SYMBOL	PARAMETER	VDD=5V±10%			VDD=3V±10%			Test condition	UNIT
		MIN.	TYP	MAX.	MIN.		MAX.		
t_{CY}	Clock cycle time	125			250			Duty=50%	ns
t_{WCK}	Clock pulse width	45			95				ns
t_R, t_F	Clock rise/fall time			30			30		ns
t_{DS}	Data set-up time	30			65				ns
t_{DH}	Data hold time	30			65				ns

9 TIMING DIAGRAM

9.1 Timing diagram for SEGMENT driver application

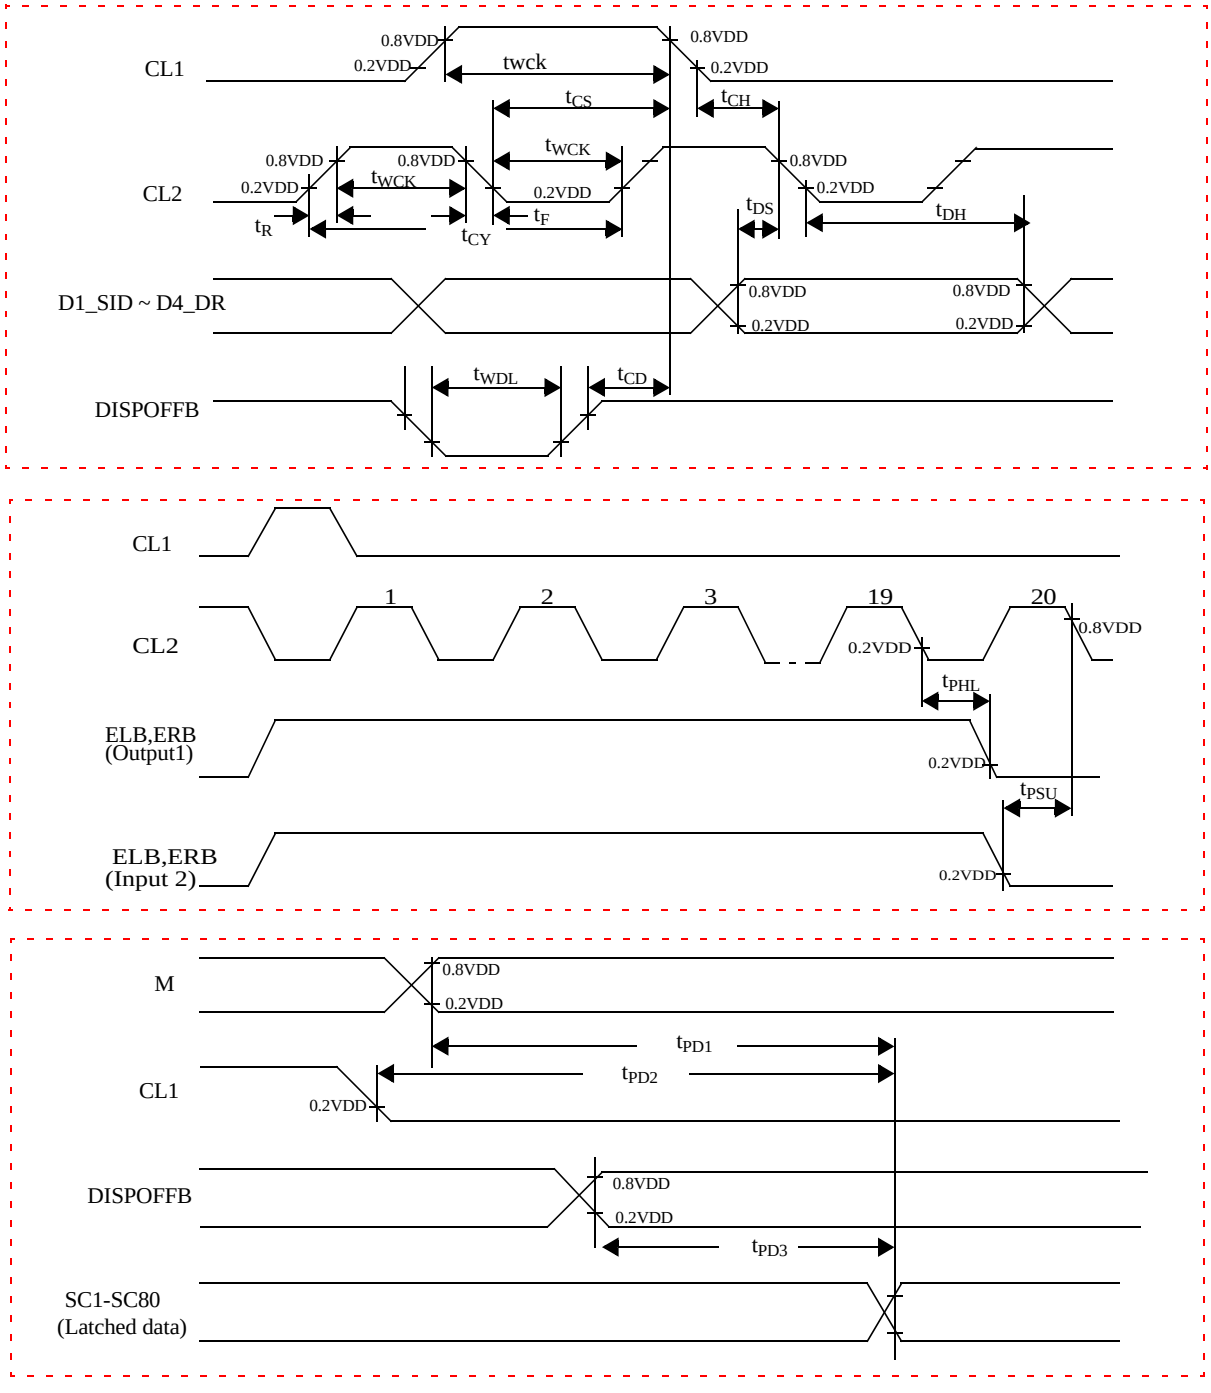

Fig.18 Timing diagram for SEGMENT driver application.

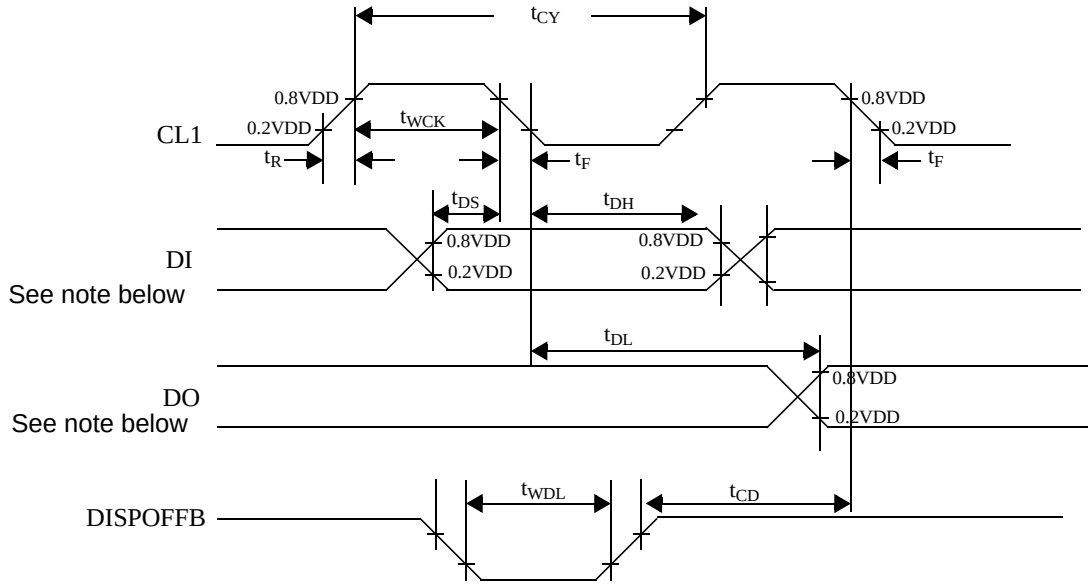
9.2 Timing diagram for COMMON driver application



Note:
When in single-type interface mode:
(1) DI=> D2_DL (SHL=L), D4_DR (SHL=H).
(2) DO=> D4_DR (SHL=L), D2_DL (SHL=H).
When in dual-type interface mode:
(3) DI=>D2_DL and D3_DM (SHL=L), D4_DR and D3_DM (SHL=H)
(4) DO=>D4_DR (SHL=L), D2_DL (SHL=H).

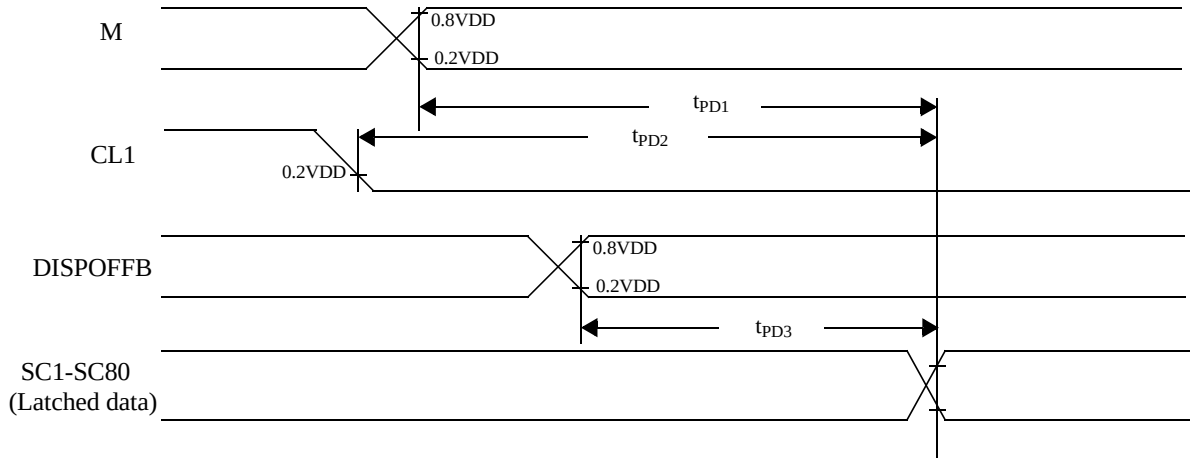


Fig.19 Timing diagram for COMMON driver application.

10 POWER DOWN FUNCTION

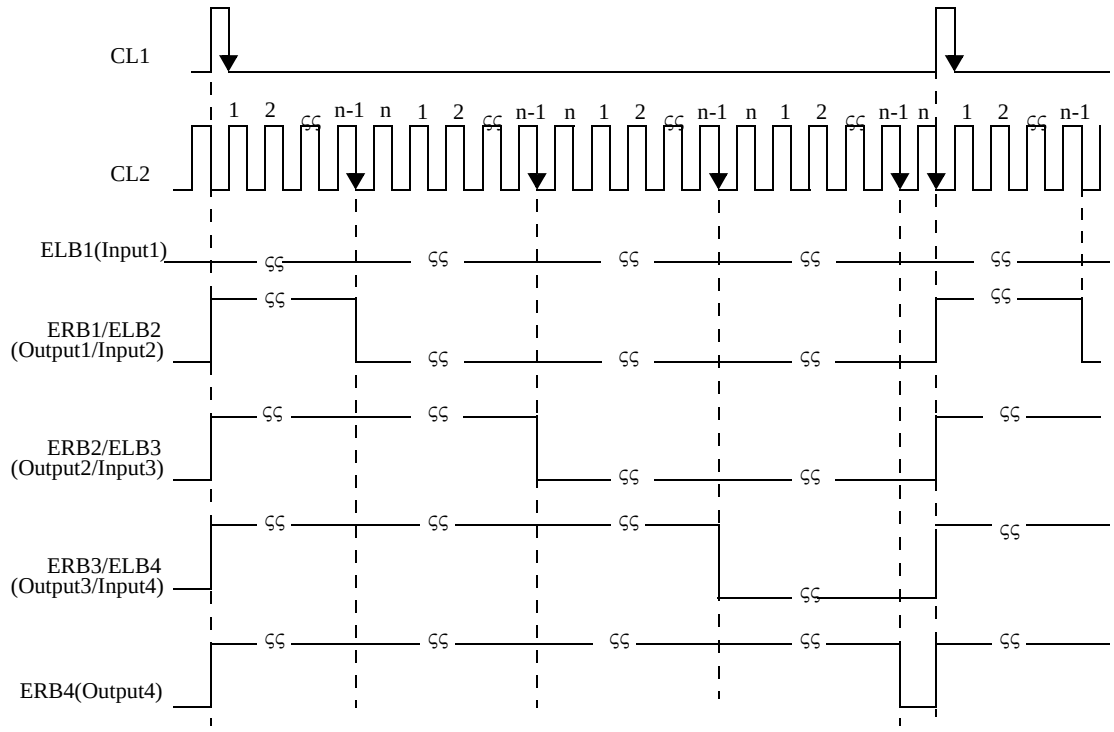
To reduce power consumption, the SDN8080G is sequentially enabled via POWER DOWN mode, when used in cascade in SEGMENT driver application.

Table 14 Power Down function.

SHL	Enable input	Enable output	current driver status (the driver being enabled)	status of other drivers
L	ERB	ELB	While ERB=LOW, current driver is enabled.	Disabled.
H	ELB	ERB	While ELB=LOW, current driver is enabled.	Disabled.

Note

1. Power Down function is not available when the SDN8080G is used as a COMMON driver.



Notes:

(1) SHL=HIGH (ELB=input, ERB=output). Current SDN8080G's ERB output must be connected to the next SDN8080G's ELB input.

(2) When in 4-bit parallel interface mode: n=20.

(3) When in 1-bit serial interface mode: n=80.

Fig.20 Timing diagram for Power Down function.

DETAIL A

NOTES:

1.JEDEC OUTLINE:MS-026 BED

2.DATUM PLANE H IS LOCATED AT THE BOTTOM OF THE MOLD PARTING LINE COINCIDENT WITH WHERE THE LEAD EXITS THE BODY.

3.DIMENSIONS D AND E DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 mm PER SIDE. DIMENSIONS D1 AND E1 DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H .

4.DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION.

SDN8080G
LQFP100 Package Outline Drawing

16 SOLDERING

16.1 Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high components densities. In these situations reflow soldering is often recommended.

This text gives a very brief description to a complex technology. A more in-depth description of soldering ICs can be provided to our customers upon request.

16.2 Reflow soldering

Reflow soldering techniques are suitable for all QFP packages.

The choice of heating method may be influenced by larger plastic QFP packages (44 leads, or more). If infrared or vapour phase heating is used and the large packages are not absolutely dry (less than 0.1% moisture content by weight), vaporization of the small amount of moisture in them can cause cracking of the plastic body. For more information, please contact Avant for drypack information.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds, depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

16.3 Wave soldering

Wave soldering **is not** recommended for QFP packages. This is because of the likelihood of solder bridging due to closely-spaced leads and the possibility of incomplete solder penetration in multi-lead devices.

If wave soldering cannot be avoided, the following conditions must be observed:

- **A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.**
- **The footprint must be at an angle of 45° to the board direction and must incorporate solder thieves downstream and at the side corners.**

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer, or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwelling time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

16.4 Repairing soldered joints

Fix the component by first soldering two diagonally- opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

17 LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Avant customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Avant for any damages resulting from such improper use or sale.

Version Release Note :

2009-Jun.25 -- Fig2,Fig3, The sharp of block corners drawing modification.

2010-March.10 -- On Fig4 , Added PAD bonding size info.
